Statement on the efficacy of Oasis Pro 20 Premium against Coronavirus

Background

Coronaviruses are enveloped viruses causing human infections. Two different guidelines are available to support efficacy of disinfectants against enveloped viruses: EN 14476, using Vacciniavirus as a surrogate virus and a guideline of the German Society for the Prevention of Virus Disease (DVV) using Vacciniavirus and Bovine Viral Diarrhea Virus (BVDV) as surrogate viruses.

Rationale

The following data are available to support efficacy against enveloped viruses for the product under discussion:

Oasis Pro 20 Premium¹⁾ 0.5%, 5 min acc. to EN 14476 under clean conditions

These data are read across from a formulation with a different dye and without a fragrance. The dye in both formulations is below 0.1% of the concentrate. The fragrance in Oasis Pro 20 Premium is below 0.5% of the concentrate. Hence, these substances are regarded below level of concern for the use dilution of 0.5% and the data are regarded valid for Oasis Pro 20 Premium.

Conclusion

It is concluded that Oasis Pro 20 Premium as a surface disinfectant is effective against Coronavirus under the above-mentioned use conditions. Surface disinfectants shall always be used at bactericidal concentration as a minimum.
