	Light Duty
	Medium/Heavy Duty
	Heavy Duty 3~

SV204T / SV306T (single seal) are classed as light duty machines, that are not designed for continuous use and are only suitable for certain applications. They are however designed for minimal operation, with occasional use throughout the day. The reason for this is mainly because of the size of their vacuum pumps which are much smaller compared with others in the range. This means that they cannot work as fast as the larger models and therefore need time for the motor to cool down. It may be that the

customer only needs a light duty machine, but if looking for a machine that can be used continuously then it would be advisable to look at some larger models. A small machine that is bought with the intention of being used regularly would need to be serviced more often and the oil would need replacing more frequently than necessary which would be costly for the customer.

SV410 / SV420 (twin seal) are classed as medium/heavy duty machines. These machines are designed for continuous use and will cope in most busy establishments.

SV520 (twin seal) upwards are also classed as heavy duty machines and there are various sizes of machine available depending on what is required.

There are certain questions you can ask to judge if the machine will be suitable for the customers needs. For example,
 what size establishment will the machine be going in to?
 How often does the customer intend to use the machine?
 Lastly what will be vacuum packed?
